I want to build a recipe tracking app based off the criteria in this PDF:

I built `recipe_tracker.py` from your design doc. I ran every route function in a quick test (adding, validating, viewing, favoriting, filtering, stats, deleting) and they all worked. I didn't launch the actual Drafter server, so run it once in your own setup to see the pages.

How it matches your design

- Dataclasses: `Recipe` (name, category, servings, ingredients, instructions, cost, macros, favorite) and `State` (recipes, message, selected, category_filter, favorites_only). All five `State` fields change somewhere in the routes.
- Routes (10): `index`, `add_recipe`, `save_recipe`, `view_recipe`, `recipe_page`, `toggle_favorite`, `delete_recipe`, `filter_page`, `apply_filter`, `stats_page`.
- Pages: index, add, view, filter, and stats.
- Inputs: `SelectBox` (index, add, filter), `TextBox` and `TextArea` (add), `CheckBox` (add and filter).
- If statements: blank name, duplicate name, servings below 1, negative cost or macros, valid selection before delete, category and favorites matching, high-protein label, and favorite label.
- Loops: `matching_recipes` loops over `state.recipes` and checks each recipe against the category and favorites filters. The index page and the stats page also loop over the recipes.
- No global variables: only the constants `CATEGORIES`, `FILTER_CATEGORIES`, and `HIGH_PROTEIN_GRAMS`.

Choices I made where your doc was open

- Macros: I made them `[protein, carbs, fat]` in grams, with three separate text boxes, matching the order suggested in your LLM chat.
- Stats page: it shows recipe count, favorites, highest protein, and a count per category, which fills in the part you weren't sure about.
- Number fields: the number text boxes are read as text and converted by a small `to_float` helper, so typing letters shows an error message instead of crashing.
- Add page: I put cost on it, since it's in your `Recipe` dataclass, plus a favorite checkbox.

Two things for your submission. Your doc says to list advanced techniques, and the `to_float` helper and the `matching_recipes` helper function are good candidates to

mention. Also, since the LLM conversation section has to include every part of any chat you used, paste this conversation in there too and mark which parts of the code came from it.

If you'd rather change the categories, add a search page, or simplify anything, tell me what you want.

Recipe tracker
